INTRODUCTION TO GITHUB

As github is defined as a website and cloud-based service that helps developers store and manage their code, as well as track and control changes to their code. I honestly don't have any idea how it works and how things should be made of. At first, its hard to be familiarize with it as this is my first time encountering this kind of website. As it has different functions to another website that I'm using. When I first thought and saw the word "code" in the website, my mindset hit me that this is not my forte and it would be a hard subject for me because I never knew that this subject is included in our course Tourism Management. But then, as time passed by and as our professor provide hands-on and teaching about it, things are getting easier and I'm getting more comfortable in using it. Thanks to Ms. Jen who make thing work easier in terms of our collaboration and communication with her and to our other colleagues. It also helps us organize and stored the files that are being done in her subject which is a big opportunity for the students in passing this subject.

Overall, it may be hard and stressful at first but then if you exert effort to know and be familiarize to it, it is more easier to use for you. It also benefits not only with this subject but rather, it will help you in the future to secure you files and it will not be easily to get lost because with this website, you can store a lot of files not only documents, as well as photos and etc. It's so satisfying and overwhelming that GitHub has been introduced to me as this is not inline with our course, I'm so happy that I knew something that is not related but then will give less work to us in the future.
